CaseStudy3

Justin Glommen 2/23/2017

Setup

Setting up the dataset and the actual data realization information into accessible variables for analysis.

```
# Assuming the data is from the same working directory as this file
gene <- read.table("hcmv.txt", header=TRUE)</pre>
# Actual data
N <- 229354
                 # Population size
n <- 296
                 # Sample number of palindromes
editGene <- gene
site.random <- editGene[["location"]]</pre>
# Display the data
site.random
            177

The Data

Here a strip plot is shown to visualize where palindromes are distributed, by laying out all possible palindrome location sites and displaying binary values representative of palindrome occurances.

```
library(lattice)
stripplot(site.random, pch=16, cex=0.25, xlab="Palindrome Location (Actualized Data)")

          21943
```

Plotting the uniform random distribution with a strip plot, we can compare it to the actualized data above.

```
library(lattice)
stripplot(site.random, pch=16, cex=0.25, xlab="Palindrome Location (Simple Random Simulation)")

0 50000 100000 150000 200000

Palindrome Location (Simple Random Simulation)
```

It's easy to notice that while although similar, the actualized data may appear to have a couple more dense clusters than what was generated via the simple sample. We will need to perform more testing to confirm whether these apparent clusters are statistically significant within the actualized data.

Monte Carlo Uniform Simulation

Here we are
B <- 1000 # 1000 bootsrap uniform samples
monteCarloSampleDists <- vector(mode="logical", length = B)
monteCarloSampleDists.mean <- vector(mode="logical", length = B)
for (i in 1:B) {
 monteCarloSampleDists[i] <- vector(mode="logical", length = n)
 monteCarloSampleDists[i] <- runif(n, min = 1, max = N)
 monteCarloSampleDists.mean[i] <- mean(monteCarloSampleDists[i])
}</pre>

```
